Parametric Cost Modeling for Buildings Sep 30 2019 Successful cost management and value engineering in construction is based on accurate and early estimations of cost, and this book is the quickest route to creating a cost plan from scratch. The budgeting system described in this book will help the reader to: document project scope at a level that provides excellent cost control at design stage establish the parameters of potential sites before selecting one determine the amount of financing needed before deciding to bid on a project make a detailed and robust building project budget determine the rental rate necessary to see if a building project will be marketable The technique used is a parametric cost system, not the square foot cost

system used by most who quote an up-front building cost. To help calculate the parameter quantities and price them as quantified, this book comes with 5 electronic templates to calculate program scope; i.e. - space, configuration, HVAC loads, plumbing and electrical. It also includes: the author's parametric cost database and cost template to prepare the construction estimate a soft cost template to price out all related program costs, convert them to a monthly cash flow, incorporate financing costs and then reveal the final budget an operation and maintenance annual cost template to calculate those variable and fixed costs necessary to run the building and then convert the result into the necessary rental rate to capitalize all costs The spreadsheets, data, advice, and templates, are all introduced through a detailed case study, placing everything in an easy to understand practical context. This will prove an invaluable guide not only for estimators and cost engineers, but also developers, clients, and architects.

Geometric Programming for Design and Cost Optimization 2nd edition Dec 02 2019 Geometric programming is used for design and cost optimization, the development of generalized design relationships, cost ratios for specific problems, and profit maximization. The early pioneers of the process - Zener, Duffin, Peterson, Beightler, Wilde, and Phillips -- played important roles in the development of geometric programming. There

are three major areas: 1) Introduction, History, and Theoretical Fundamentals, 2) Applications with Zero Degrees of Difficulty, and 3) Applications with Positive Degrees of Difficulty. The primal-dual relationships are used to illustrate how to determine the primal variables from the dual solution and how to determine additional dual equations when the degrees of difficulty are positive. A new technique for determining additional equations for the dual, Dimensional Analysis, is demonstrated. The various solution techniques of the constrained derivative approach, the condensation of terms, and dimensional analysis are illustrated with example problems. The goal of this work is to have readers develop more case studies to further the application of this exciting tool. Table of Contents: Introduction / Brief History of Geometric Programming / Theoretical Considerations / The Optimal Box Design Case Study / Trash Can Case Study / The Open Cargo Shipping Box Case Study / Metal Casting Cylindrical Riser Case Study / Inventory Model Case Study / Process Furnace Design Case Study / Gas Transmission Pipeline Case Study / Profit Maximization Case Study / Material Removal/Metal Cutting Economics Case Study / Journal Bearing Design Case Study / Metal Casting Hemispherical Top Cylindrical Side Riser Case Study / Liquefied Petroleum Gas (LPG) Cylinders Case Study / Material Removal/Metal Cutting Economics with Two Constraints / The Open Cargo Shipping Box with Skids / Profit Maximization Considering Decreasing Cost Functions of Inventory Policy / Summary and Future Directions / Thesis and Dissertations on Geometric Programming

CCT Exam ExamFOCUS Study Notes and Self-Practice Review Questions for Certified Cost Technician 2018/19 Edition May 19 2021 A CCT is one who is proficient in the basic skills and knowledge of total cost management. It is just like a junior version of CCP. You may think of cost engineering as an adjunct of traditional engineering. The key objectives of cost engineering are: 1, to arrive at accurate cost estimates; and 2, to avoid cost overruns. Cost engineering encompasses a wide range of cost-related aspects of engineering management. Keep in mind, awareness of the related costs is a key factor in making the proper choice of engineering approaches to take. Although the cost engineering exam focuses primarily on the various cost analysis and estimation techniques, basic background knowledge of certain "business management" related disciplines will definitely help for those who have little experience on topics outside of the scope of traditional engineering. To be honest, without possessing solid knowledge on these topics a candidate will have a very tough time mastering the skills of cost engineering. This is especially true when the TCMF (Total Cost Management Framework) methodology is in place to integrate Asset, Operations and Project Management into a single model. We create this study book product referencing the concepts and principles currently valid in the exam. Each practice question comes with an answer and a short explanation which aids you in seeking further study information. For purpose of exam readiness drilling, this product includes questions that have varying numbers of choices. Some have 2 while some have 5 or 6. We want to make sure these questions are tough enough to really test your readiness and draw your focus to the weak areas. Think of these as challenges presented to you so to assess your comprehension of the subject matters. The goal is to reinforce learning, to validate successful transference of knowledge and to identify areas of weakness that require remediation. The questions are NOT designed to "simulate" actual exam questions. "realistic" or actual questions that are for cheating purpose are not available in any of our products. This product includes both study notes and self practice questions in MC format.
